La despensa

August Paloluoma

Login

He usado la misma función con valores distintos para el login y la creación de usuario.

```
@app.route('/')
def login():
    return render template("login.html")
@app.route('/login', methods=['POST'])
def userlogin():
    error = 0
    username = request.form['username']
    password = request.form['password']
    if 'userlog' in request.form:
        cursor = db.database.cursor()
        data = (username, password)
        submit value = request.form['userlog']
        if submit value == "crear":
                sql = "INSERT INTO users (username, password) VALUES (%s, %s)"
                cursor.execute(sql, data)
                db.database.commit()
            except(connector.errors.IntegrityError):
                error = "1"
                print(error)
        elif submit value == "login":
            sal = "SELECT * FROM users WHERE username=%s AND password=%s"
            cursor.execute(sql,data)
            var = cursor.fetchone()
            if var == None:
                error = "2"
               print(error)
                return render_template("index.html")
    return render template("login.html", error=error)
```
